

DRILL: Make a quick RFC

Look back to the potential experiments in the previous assignment. For one of those experiments, write up the essential points of an RFC for an improved version of that experiment.

Submit it and review with your mentor.

How happy are our employees? Low level of satisfaction can lead to high rates of attrition which can lead to significant expenses for the company in new-hire costs.

We hypothesize that satisfaction is not consistent across all employees types in the organization. We will evaluate the aggregate satisfaction levels for each employee type in each of the five countries that the company hires in.

By using this data, the company will have a sense of where employees are most satisfied and least satisfied – both by country and by profession. The company can then use these findings proportionally allocate resources towards increasing employee satisfaction.
